Sample copy, built from four real audits

Website conversion audit example: a medical spa

October 2026 · Prepared by Luca

A close read of where visitors slip away before booking, and the handful of changes most likely to bring them back. Every finding below was seen on a real medical spa website, or in Google's answers about a real clinic, and checked on 2, 10, 14 or 28 October 2026. The four leaks come from four different clinics, put together in one report so that none of them can be recognised. Names, places, brands and prices are left out. The measurements are the ones I took.

4	3	4
leaks found, each one measured on the live page	things already working, worth protecting	changes, in the order I would make them

What is already working

An audit that only lists problems reads like a sales pitch. These are the strengths worth protecting.

An award on the first screen

The homepage shows an award badge dated 2025 at the bottom of its first screen. A visitor who has never heard of the clinic gets a reason to trust it before scrolling.

The price is published

The clinic states what its wrinkle injections cost per unit, in its online booking menu. Some of the clinics I look at publish no figure at all. This one has already decided to show it, which makes Leak 02 a question of where, not whether.

Patients' words, already collected

The site has a reviews page with a slideshow of testimonials. The work of asking patients and gathering what they said is done.

Protect these while you fix the leaks on the following pages.

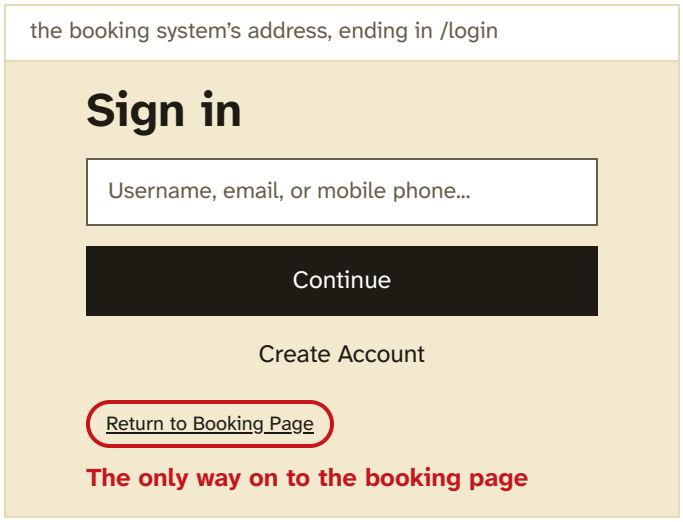

Leak 01 · Every booking button · Effort: low

Every booking button opens a sign in screen

What I found

The book button in the menu, three more on the homepage and both booking buttons on the page about injectables all lead to the same place: the sign in form of the clinic's booking system. It asks for a username, email or mobile phone, with a button to create an account under it. The way on to the actual booking page is a small link lower down that reads "Return to Booking Page", set in 14 pixel type under a 40 pixel heading. I collected the booking links from 19 pages of the site and all of them point to that one sign in address. I checked them on 2 October.

WHAT A NEW PATIENT SEES AFTER PRESSING BOOK

Drawn from my measurements, not a screenshot, so the clinic stays unnamed. Type sizes are in proportion: the heading is 40 pixels on the real page, the link 14. The link sits 381 pixels below the heading, in a window 633 pixels tall.

How I checked it

- Collected every link to the booking system from the code of 19 pages of the site: one single target, the sign in address.
- Opened that address in Chrome and read the screen as it renders: a sign in heading, one field, Continue, Create Account, a Google sign in, then the link back to the booking page.
- Measured the screen in a window 1,200 pixels wide: the heading is 40 pixels tall, the Continue button 571 by 46, the link back 148 by 17 in 14 pixel type.
- Took two screenshots 19 seconds apart, to be sure the screen had finished loading.
- Checked that the homepage button is really the thing a click lands on, and not covered by something else.

Why it matters

A new patient who presses Book wants to see which times are open. She is asked to sign in to an account she does not have. Returning patients may well sign in, and I did not go past that screen, so I cannot say what they see next. The first time visitor is the one this stops.

What fixing it changes

The sign in screen itself carries a link back to the booking page, so the page a new patient needs is already there. Nothing has to be built.

The fix

Point every booking button at the booking page, not at the sign in page.

Leak 02 · Injectables page · Effort: low

The price is four steps away from the page that describes the treatment

What I found

The injectables page describes the clinic's wrinkle injections in one line, with no price and no button to book them. The page body holds no link and no button at all: the only way to book from it is the item in the top menu. The price does exist. It is inside the booking tool, four steps in: book online, individual appointment, injectables, then the treatment. I read the page as it renders and as the server sends it, and walked the booking menu, on 10 October.

Drawn, not a screenshot. The left pane is the page a visitor reads. The right pane is the only place the price appears, and the page on the left has no link to it.

How I checked it

- Searched the text of the page as it renders for a dollar figure, "per unit" and "starting at": no match.
- Fetched the page as the server sends it and searched again: no price in it.
- Walked the page in three screenshots: treatment names, descriptions and what each works for, nothing else.
- Counted the links and buttons in the body of the page: 0 and 0. The only booking link is in the top menu.
- Walked the booking menu to the treatment and read the price twice, 22 seconds apart. I added nothing to the cart and chose no time.

Why it matters

A visitor who reads about the treatment and wants to know what it costs finds no figure and nothing to press. Whether showing a price helps or hurts depends on what visitors expect: two field experiments went in opposite directions, and I wrote about both in the hidden prices article on dropoffaudit.me. That question is already settled here, because the clinic publishes its price. It only does so in a place a reader of this page never reaches.

What fixing it changes

The visitor gets the figure on the page where they are deciding, and a way to act on it.

The fix

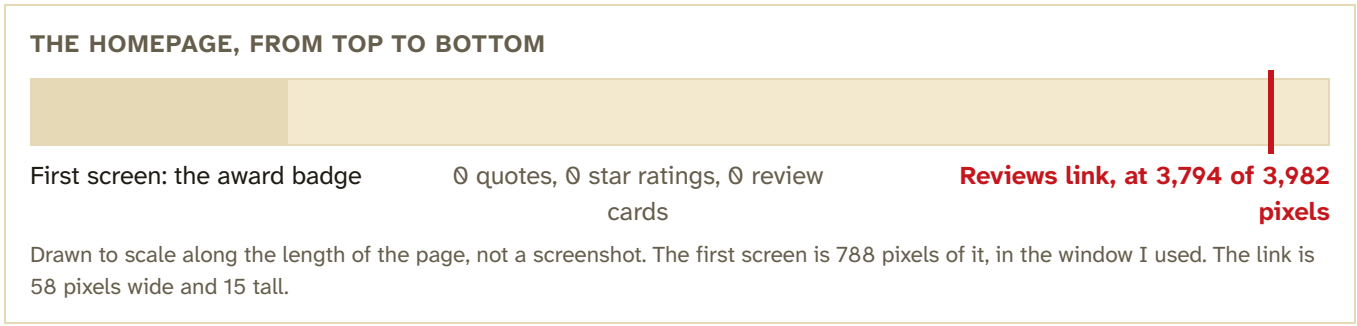

Put the per unit price on the injectables page, next to the treatment, and add a booking button under it.

Leak 03 · Homepage · Effort: low

The homepage carries no patient's words, and the reviews page is one small link in the footer

What I found

From the first screen to the footer, the homepage shows nothing a patient said: no quote, no star rating, no review card. I walked it in five screenshots and searched its text. The clinic's testimonials sit on a separate reviews page, and the only way there from the homepage is a link in the footer list, 15 pixels tall, 3,794 pixels down a page that is 3,982 pixels long. The menu at the top of every page has no reviews item. I checked this on 14 October.

How I checked it

- Counted the links to the reviews page on the homepage: one, in the footer list, 58 by 15 pixels.
- Searched the homepage text for quotation marks, testimonials and patients' names: 0 matches.
- Looked for a review widget, a slideshow or an embedded frame after scrolling to the bottom, on a second opening of the page: none.
- Walked the page in five screenshots, from the top to the last pixel. The only trust mark in them is the award badge.
- Read the top menu on every page: four items, with eight treatments under one of them. None is Reviews.
- Opened the reviews page: a slideshow of 18 slides with patients' words in it.

Why it matters

To find them, a visitor has to scroll the whole homepage and pick one small link out of the footer list. A visitor who wants to hear from other patients before booking may well go to Google instead, and that is fine. What remains is that the clinic's own collected praise is not on the homepage. On what the research does and does not say about reviews, see the reviews article on dropoffaudit.me.

What fixing it changes

The award badge on the first screen stops being the only proof on the page.

The fix

Put two or three of the testimonials on the homepage, above the footer, and add Reviews to the top menu.

Leak 04 · Google's AI Mode · Effort: unknown

Asked three times for the treatment in the clinic's town, Google's AI Mode never named the clinic

What I found

On 28 October, between 09:46 and 09:49 UTC, I asked Google's AI Mode for the clinic's main injectable treatment in its town, three times, at least a minute apart. Each answer named five or six businesses. Four of them were named in all three answers. The clinic was named in none, though its site offers the treatment and the clinic is in that town.

WHO GOOGLE'S AI MODE NAMED, THREE TIMES

Business named	09:46 UTC	09:47 UTC	09:48 UTC
Business A	●	●	●
Business B	●	●	●
Business C	●	●	●
Business D	●	●	●
Business E	●	●	
Business F		●	
Business G			●
The clinic	**not named**	**not named**	**not named**
Businesses named	5	6	5

The other businesses are real and were named in the answers. Their names are replaced with letters here because naming them would give the town away.

How I checked it

- Asked the same question three times, each time on a newly opened page, more than a minute apart.
- Read the full text of each answer and searched it for the clinic's name: absent all three times.
- Took a screenshot of each answer with the list of businesses in view.
- Read the clinic's own services page, to be sure it offers the treatment it was missing for.

Why it matters

A patient who asks that question gets a short list, and this clinic is not on it. That is all the three answers show. They are one morning's answers, from a browser signed in to a Google account and connecting from Italy. AI Mode answers change and can be personalised, and three answers are not a ranking. I found no study that measures what this does to a clinic's bookings. What has been measured is that people click through to websites far less when Google answers this way. The study is in the AI Mode article on dropoffaudit.me.

What fixing it changes

I cannot promise that any change to a site gets a clinic named. Nobody has measured that, and anyone who sells it is guessing.

The fix

Start with what such a system reads first, which is in the clinic's hands: check that the page title, the description and the business record in the page code each say the treatment and the town in plain words. Then ask the same question again in a month and compare.

The four leaks in numbers

Every figure below was measured on the live page or read in the answer itself. None is an estimate.

Leak 01	19 pages read, every booking link on them collected: 1 target, a sign in screen. The way on is a link in 14 pixel type under a 40 pixel heading.
Leak 02	0 prices, 0 links and 0 buttons in the body of the injectables page. The price is 4 steps inside the booking tool.
Leak 03	0 patient quotes, 0 star ratings and 0 review cards on a homepage 3,982 pixels long. 1 link to the reviews page, 3,794 pixels down. 18 slides of patients' words on that page.
Leak 04	3 questions to Google's AI Mode, between 09:46 and 09:49 UTC. 7 businesses named, 4 of them all 3 times. The clinic named 0 times.

Where to start, in order

In the order I would tackle them: highest return for least effort first.

01 **Point every booking button at the booking page**

Ties back to Leak 01. Effort: low

02 **Put the price on the injectables page, with a booking button under it**

Ties back to Leak 02. Effort: low

03 **Bring two or three testimonials onto the homepage and add Reviews to the menu**

Ties back to Leak 03. Effort: low

04 **Check what the title, description and business record say, then ask AI Mode again in a month**

Ties back to Leak 04. Effort: unknown

What an audit looks at

The four leaks above are what was worth reporting. These are the things I go through on every site to find them.

- The way to a booking: every button and link that says book, followed to where it ends.
- Prices: whether a visitor can find what a treatment costs, and how many steps it takes.
- What patients say: testimonials on the site, and the clinic's Google reviews.
- Links, buttons, phone numbers and email addresses that do not do what they say.
- Leftovers: expired offers, old dates, template text that was never replaced.
- The wording, quoted exactly, where a sentence leaves a visitor unsure what is offered.
- What the site hands to search engines and assistants: the title, the description and the business record.
- Google's AI Mode, asked three times for a treatment in the clinic's town.
- Google's public ad library: whether the clinic is advertising, and what a visitor arriving from an ad meets.

What this audit does not contain

- Any percentage, any revenue estimate, any borrowed industry figure. The impact of each leak is described, not invented.
- The names of the clinics. Where a detail would identify one, it was left out, not changed.
- Anything behind a login or a submitted form. I did not create an account, send a booking or call a phone line.

Questions about anything in this audit? Email me at luca@dropoffaudit.me. I read every response personally.
